PHOTOSYNTHETIC RESPONSE AND ADAPTATION TO TEMPERATURE IN HIGHER PLANTS

Joseph Berry and Olle Björkman<sup>1</sup>

...and can impact carbon cycling and climate...

Acclimation alters future temperature by >1°C

...but the mechanisms underlying  
photosynthetic acclimation are  
not well known

Solution: A testable, theoretical model!

## Least cost theory

Maintain fastest rate of photosynthesis at the lowest cost (water and nutrient use)

# Biochemistry optimization: Coordination hypothesis

Photosynthesis may be limited by  
multiple processes

# Biochemistry optimization: Coordination hypothesis

Photosynthesis may be limited by multiple processes

Optimally, plants will coordinate their  
biochemistry to be equally limited by  
these processes

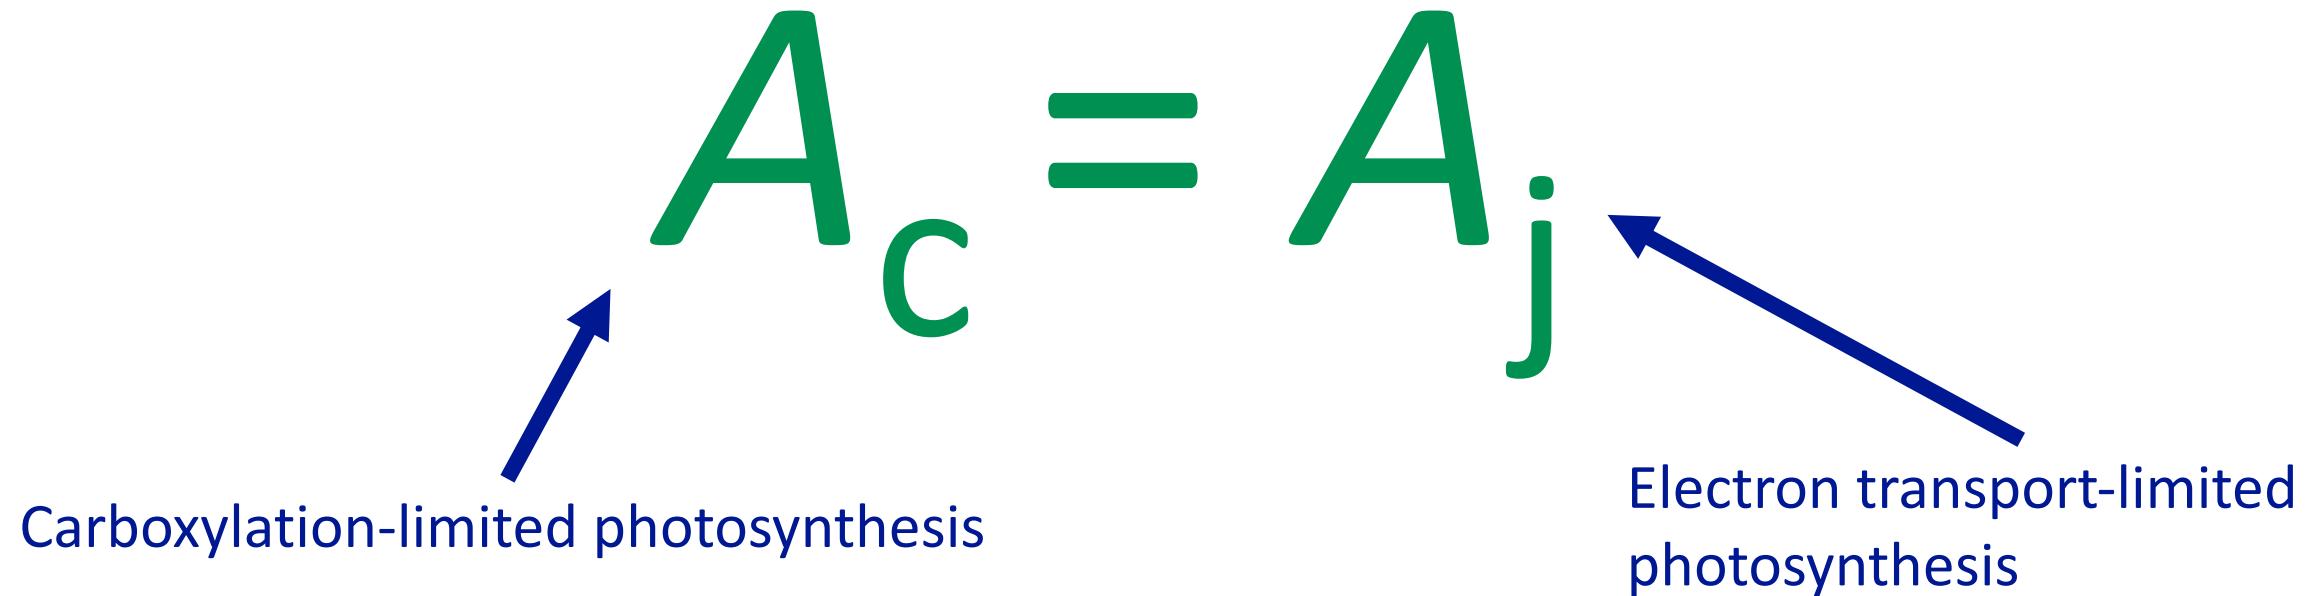

# Coordination of photosynthesis

Optimally...

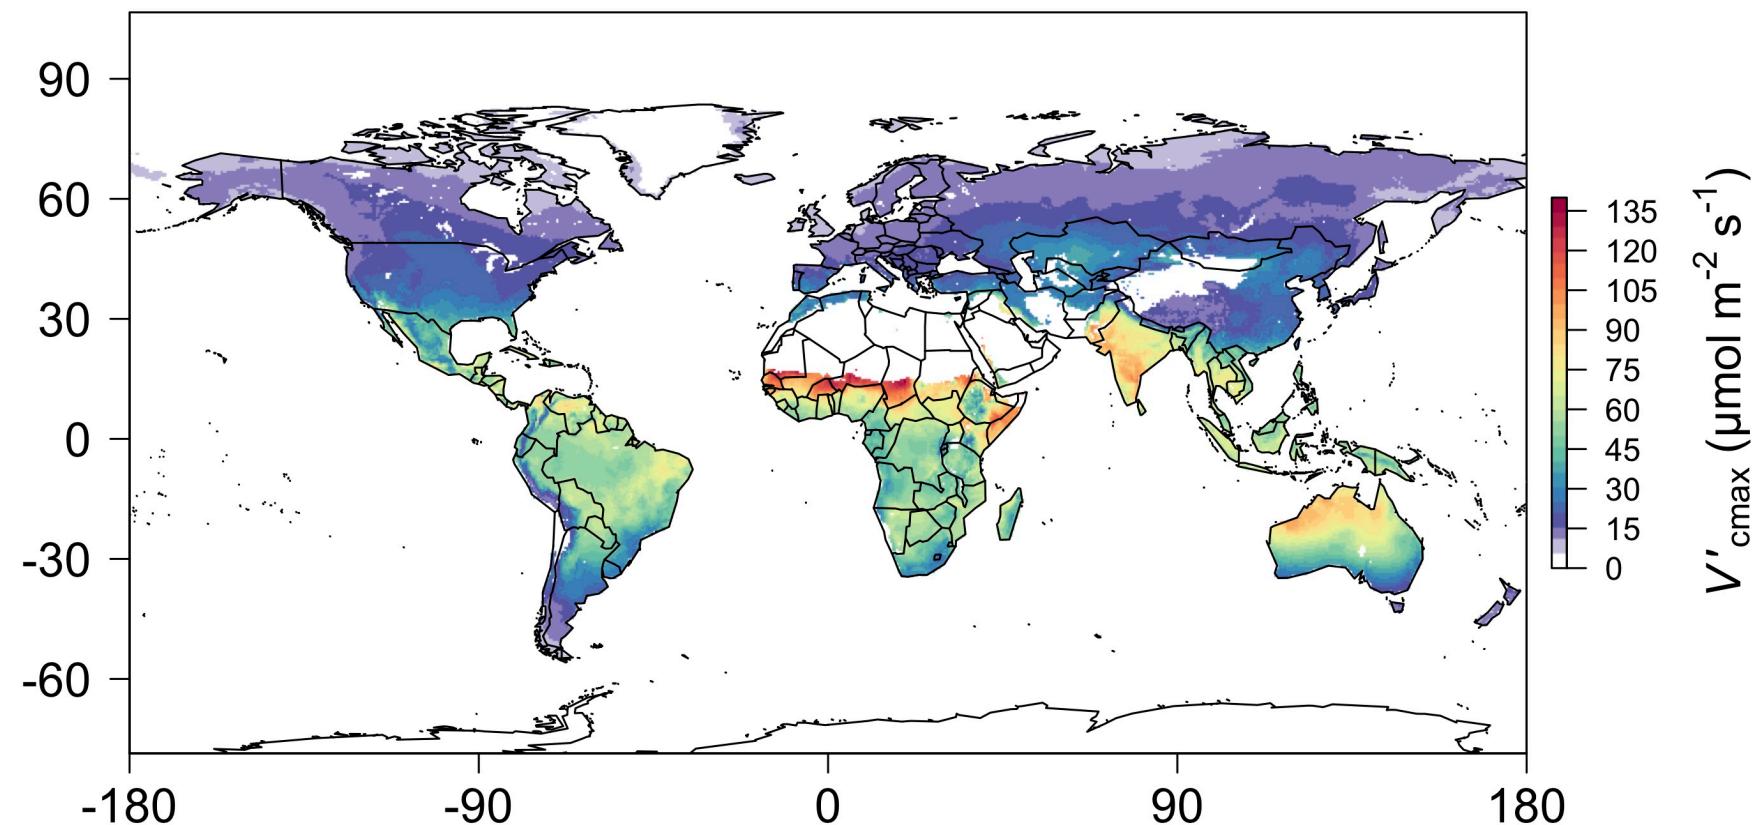

$$A_c = A_j$$

Carboxylation-limited photosynthesis

Electron transport-limited photosynthesis

We can predict optimal traits in different environments

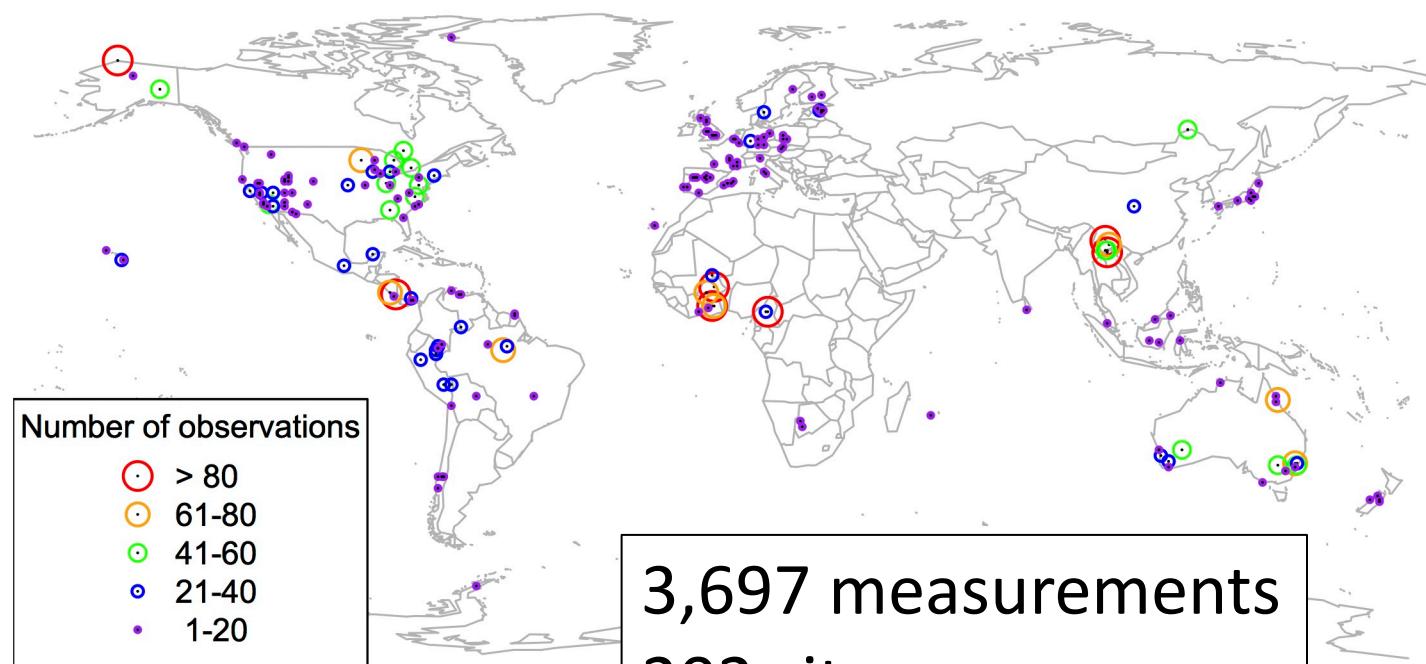

Ok, great, but now what?

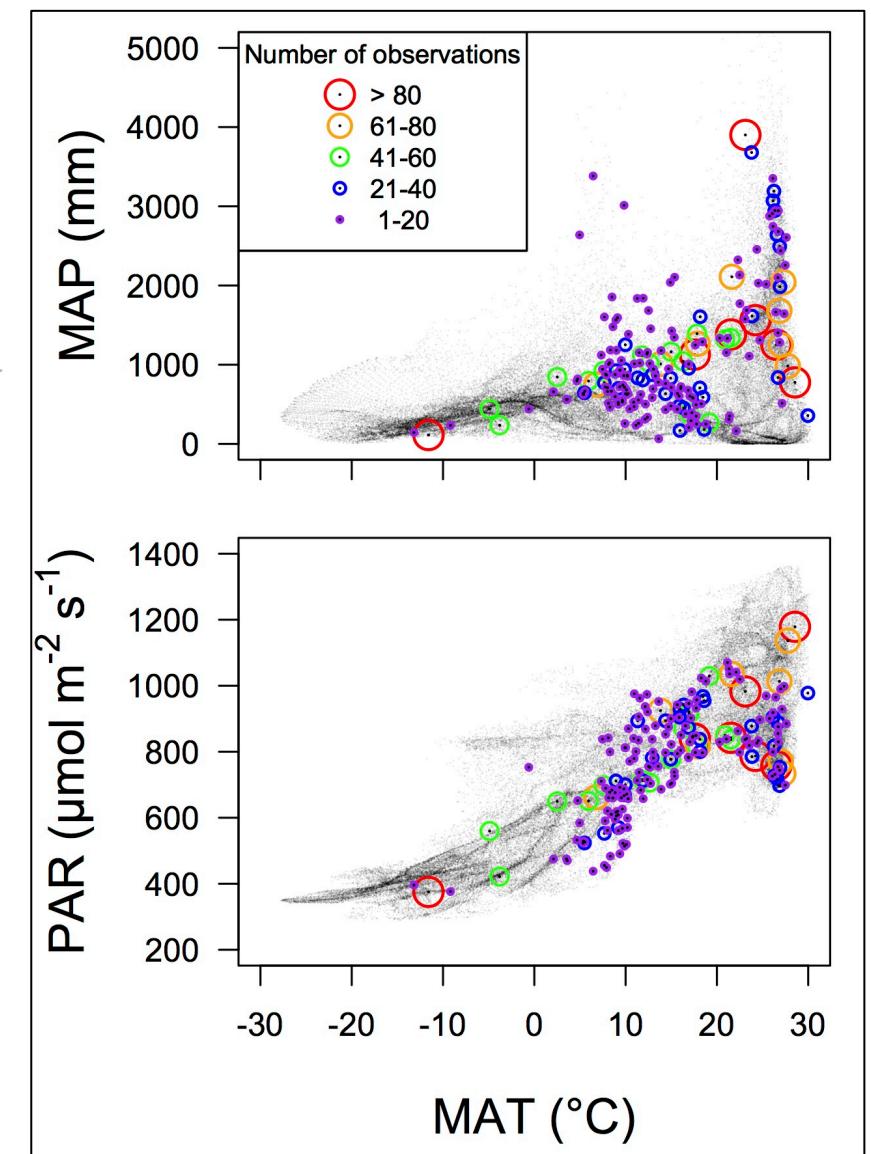

Let's tackle some big questions in  
plant ecophysiology!

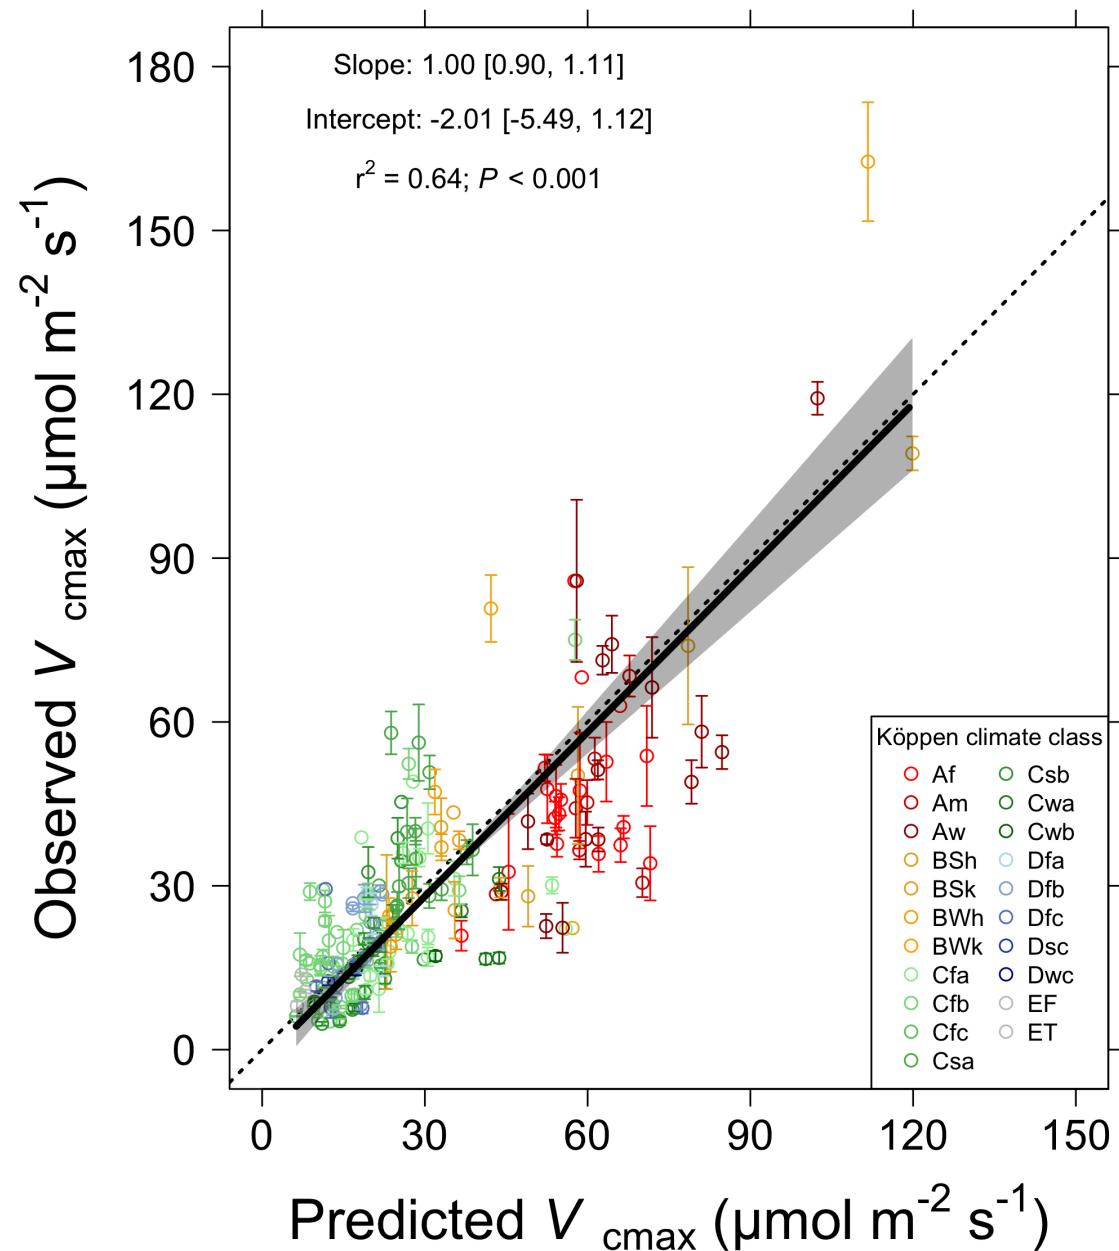

Question 1: Is photosynthesis  
optimized to the environment?

# Global $V_{cmax}$ dataset

3,697 measurements  
202 sites  
> 600 genera

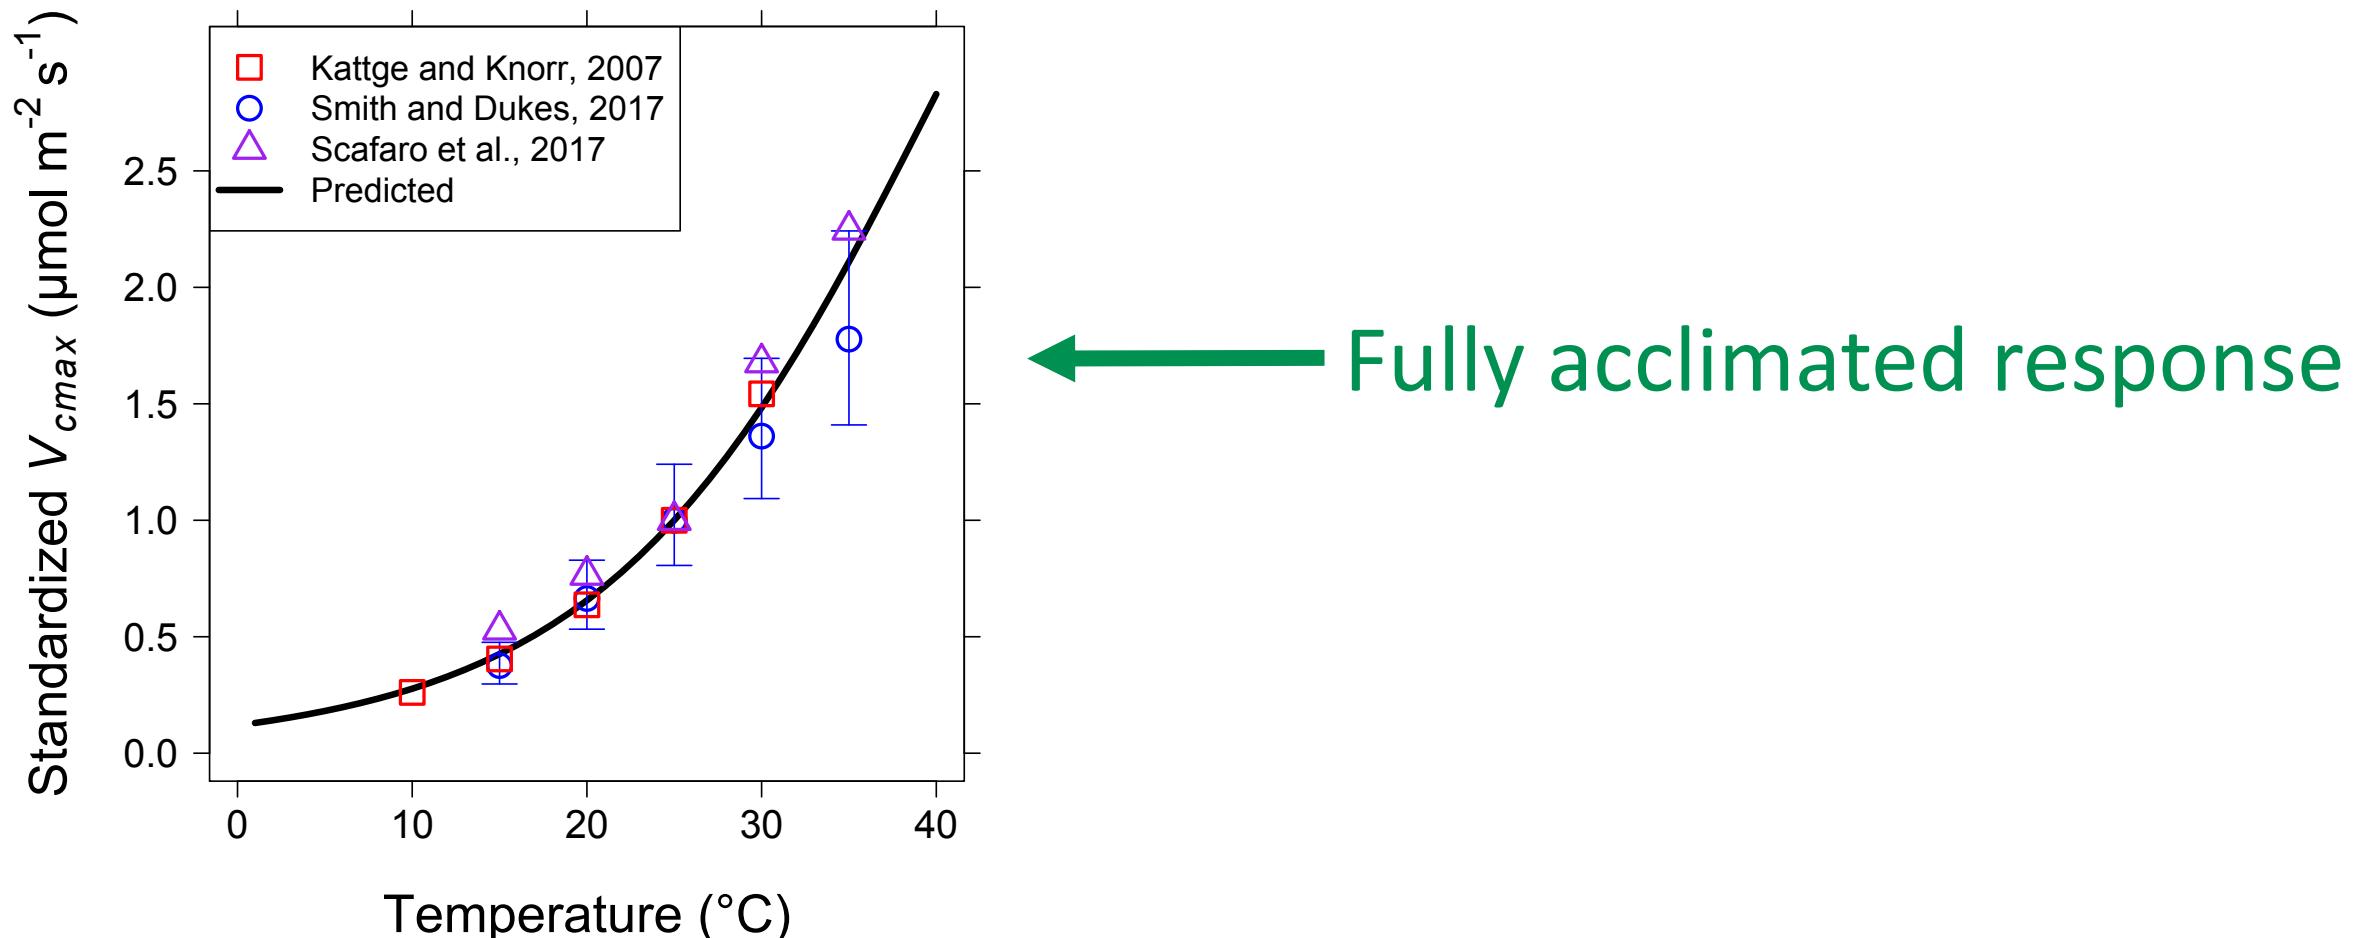

Question 1: Is photosynthesis optimized to the environment?

YES! Photosynthesis acclimates spatially as expected from optimization

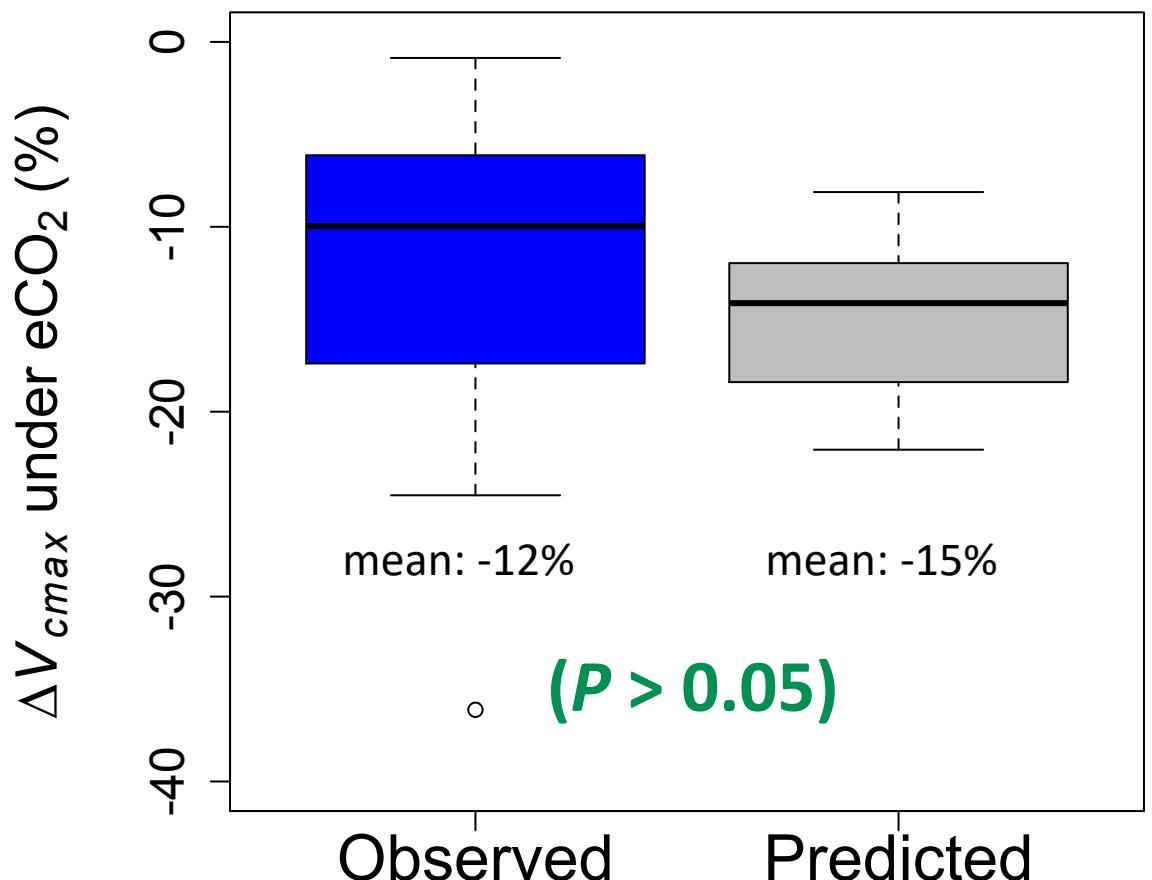

Question 2: How will  
photosynthesis acclimate to  
future conditions?

Photosynthetic traits change with temperature  
and CO<sub>2</sub> in ways expected from optimization

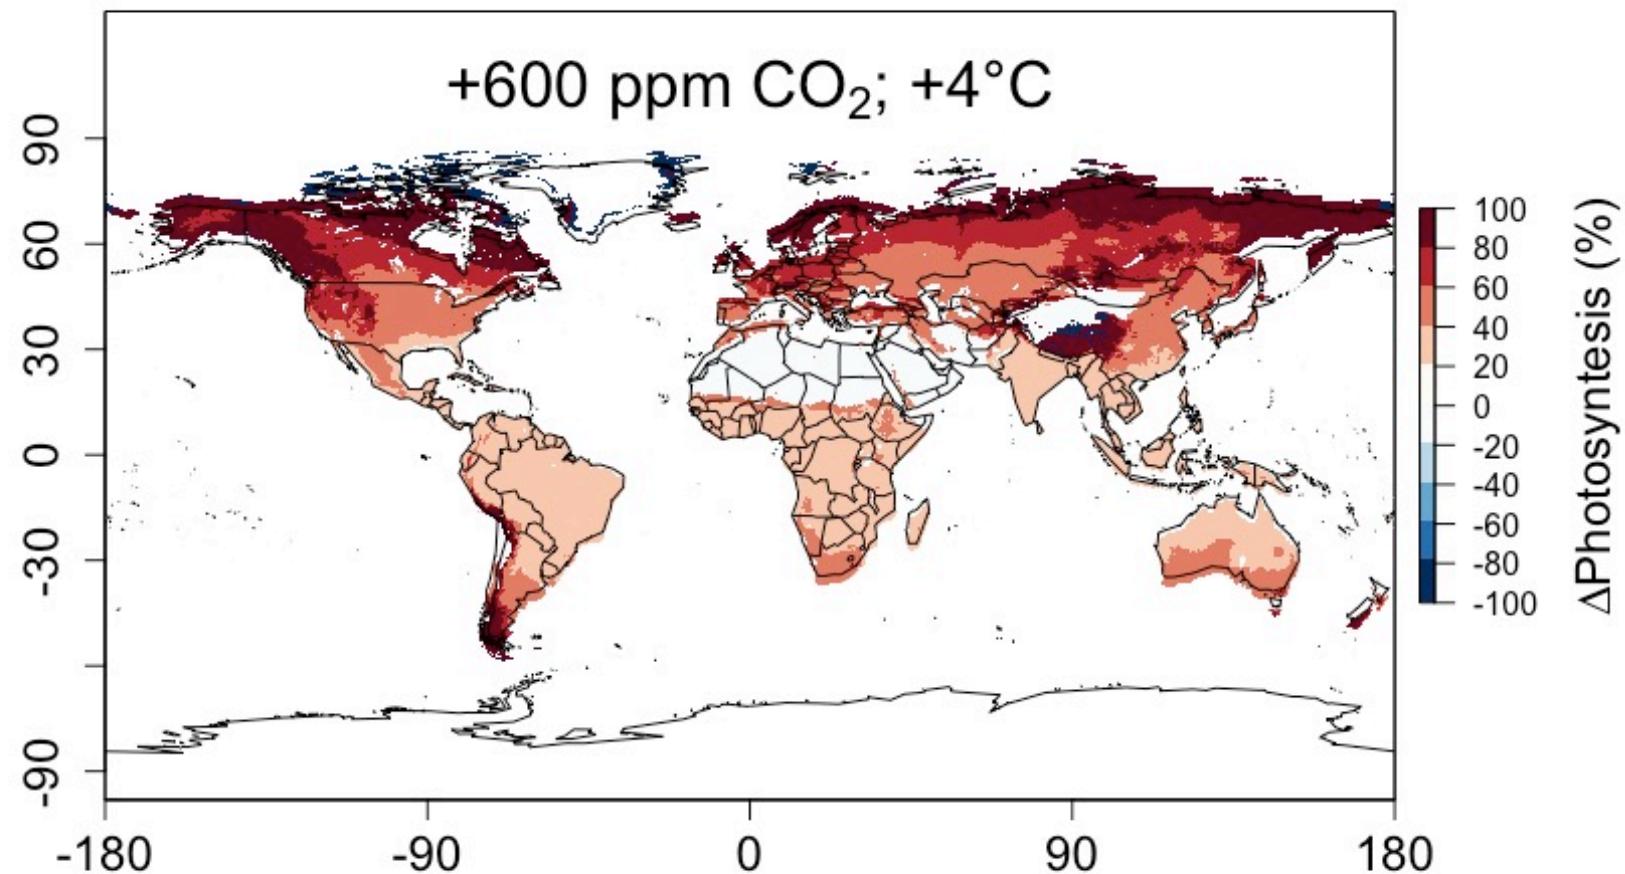

# Photosynthetic traits change with temperature and CO<sub>2</sub> in ways expected from optimization

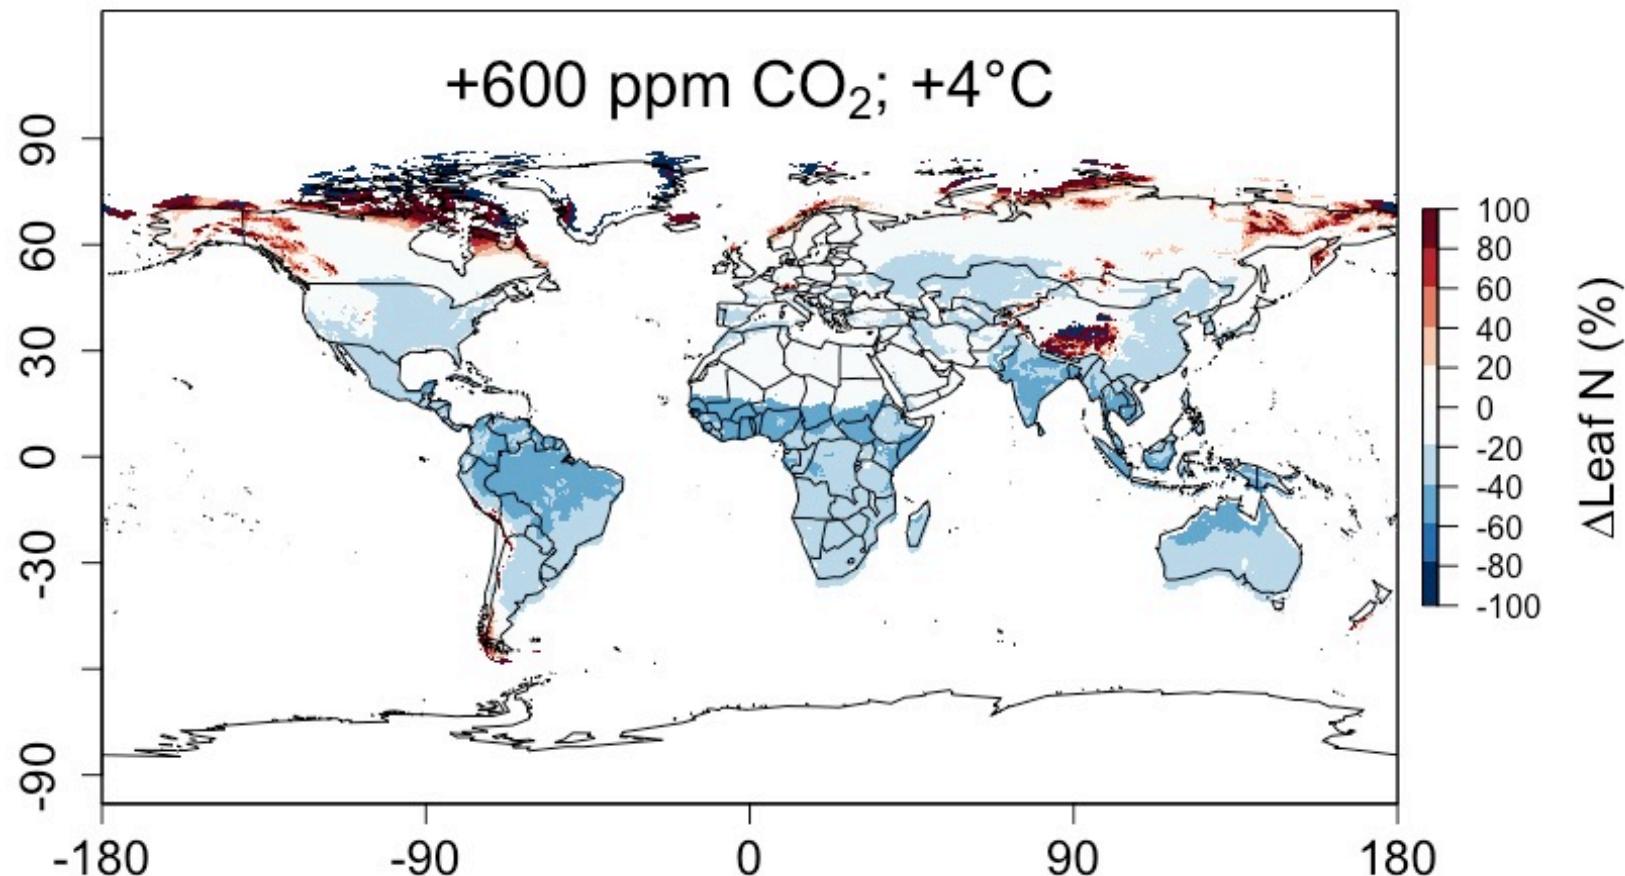

# Photosynthetic traits change with temperature and CO<sub>2</sub> in ways expected from optimization

# Higher CO<sub>2</sub> and increased temperatures increase future photosynthesis

Higher CO<sub>2</sub> and increased temperatures increase future photosynthesis (at lower nutrient use)

Question 2: How will photosynthesis  
acclimate to future conditions?

Photosynthesis will increase and per-  
leaf-area nutrient use will decrease

# Question 3: Does photosynthesis respond to nutrient addition?

Lizz Waring  
TTU

From the least cost hypothesis...

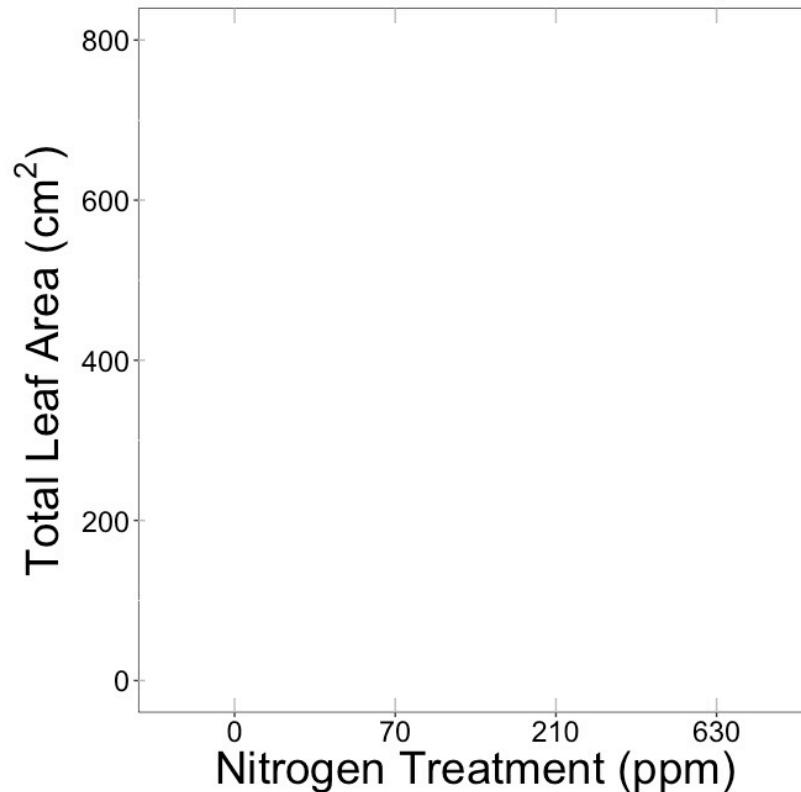

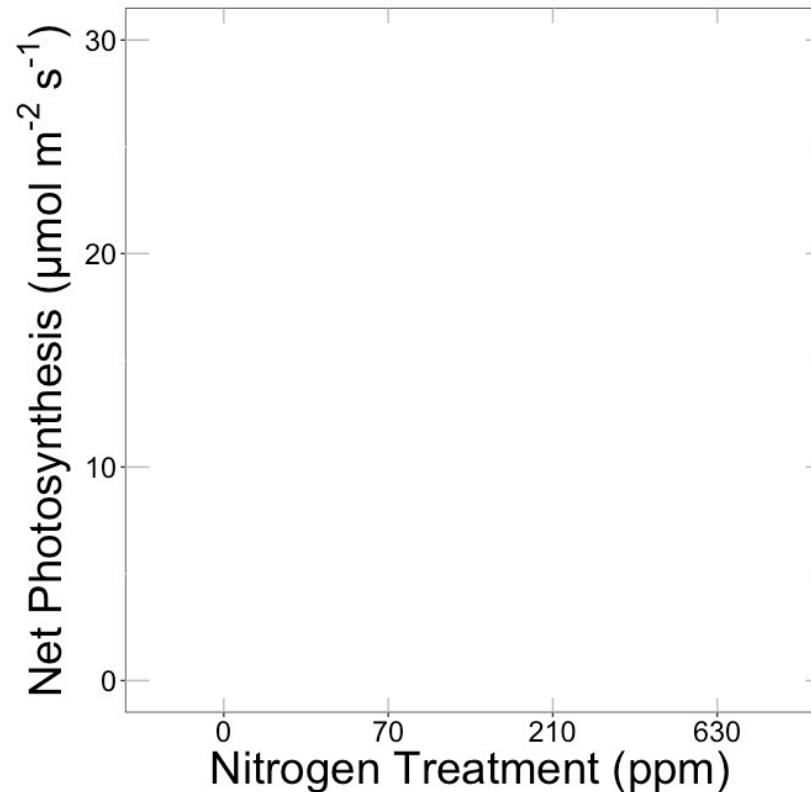

Added nutrients will not increase photosynthesis  
because light limitation will kick in

From the least cost hypothesis...

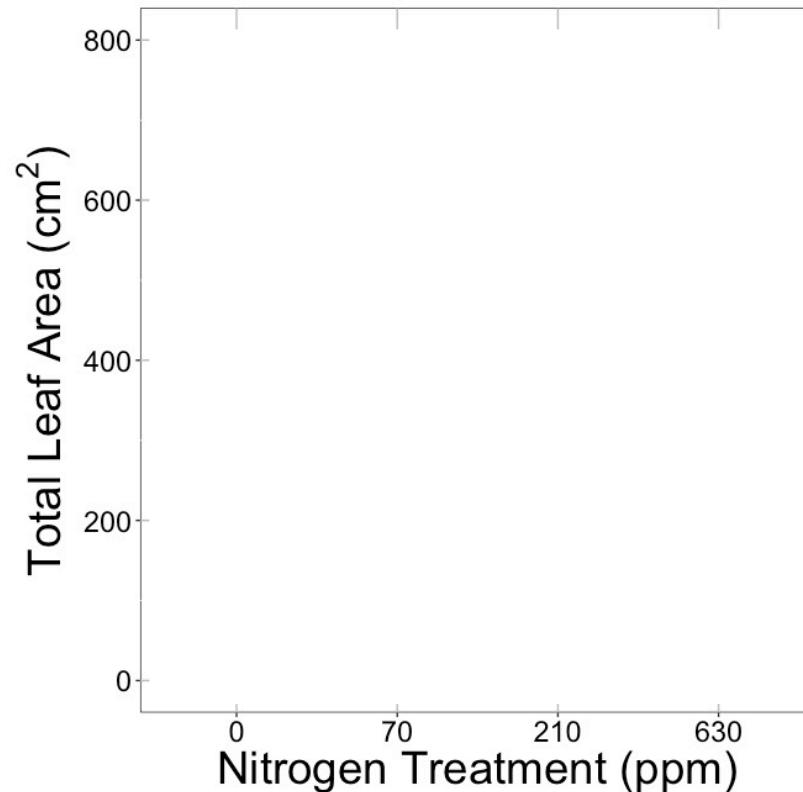

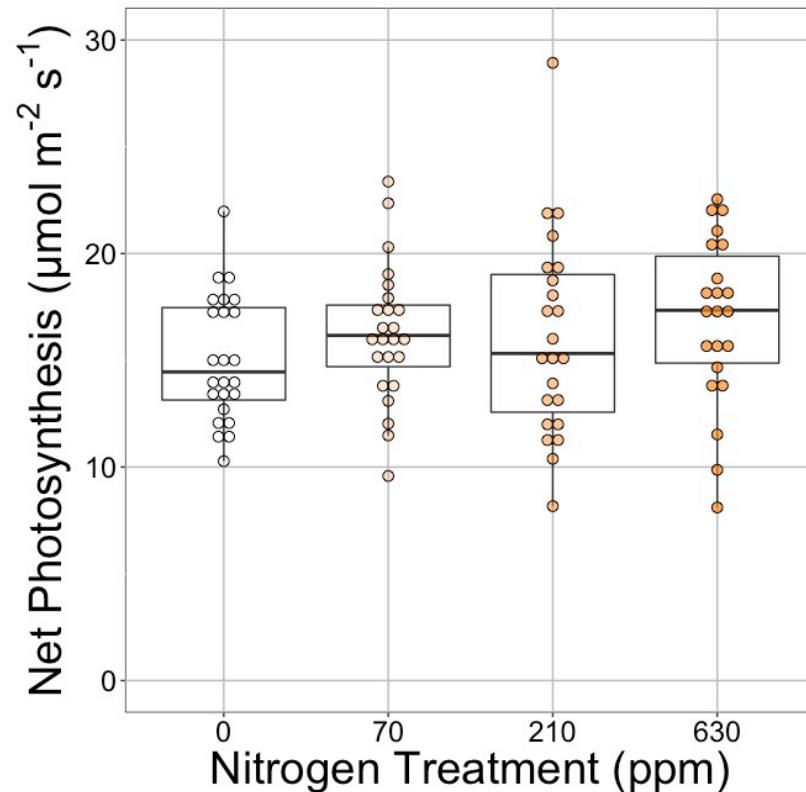

Added nutrients will not increase photosynthesis  
because light limitation will kick in

**Optimal response would be to  
increase leaf area**

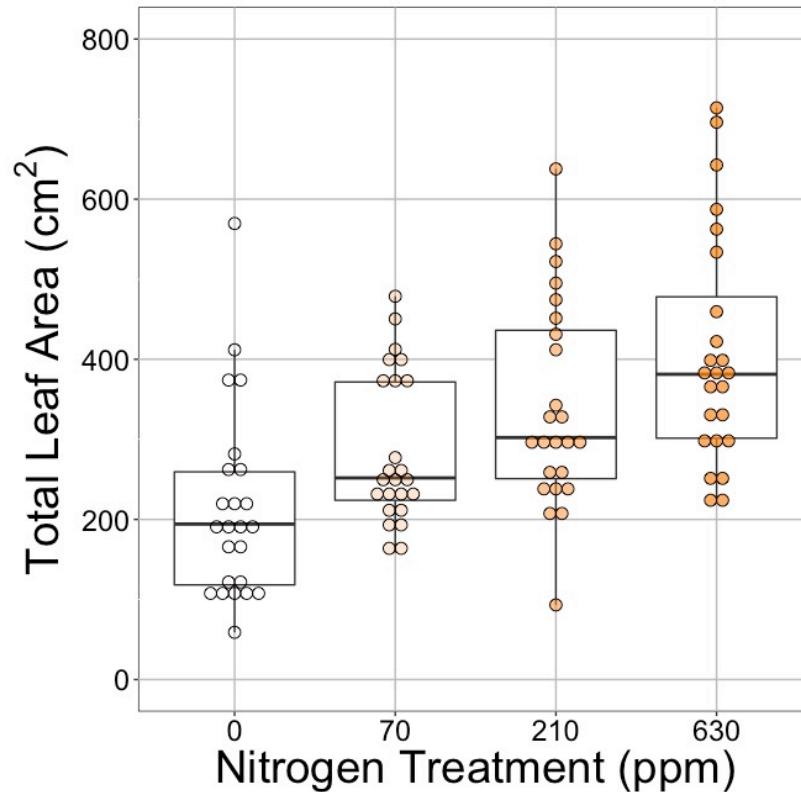

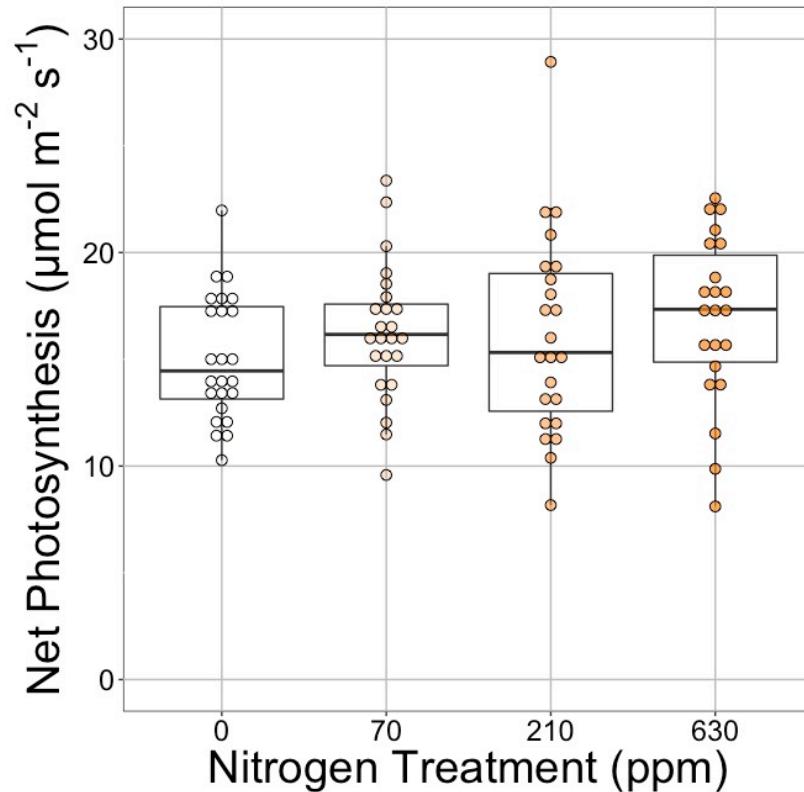

# Leaf area, but not photosynthesis increases with N addition

# Leaf area, but not photosynthesis increases with N addition

# Leaf area, but not photosynthesis increases with N addition

But do greenhouse experiments  
translate to the field?

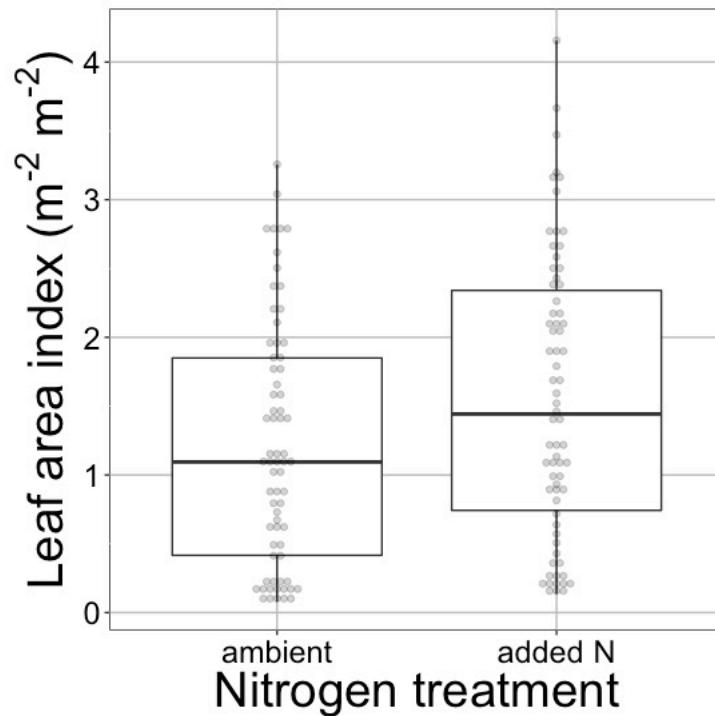

nutrient  
network

Grassland soil nutrient addition network:

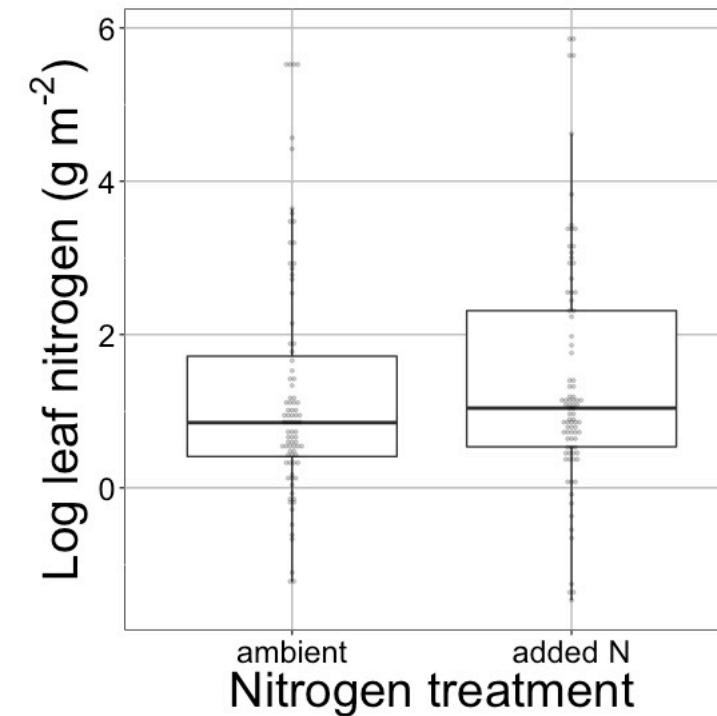

1. Leaf area index
2. Per-leaf-area nitrogen (photosynthetic proxy)

# Globally, N addition increases leaf area, not leaf N

41% increase ( $P < 0.05$ )

No change ( $P = 0.42$ )

Question 3: Does photosynthesis respond to nitrogen addition?

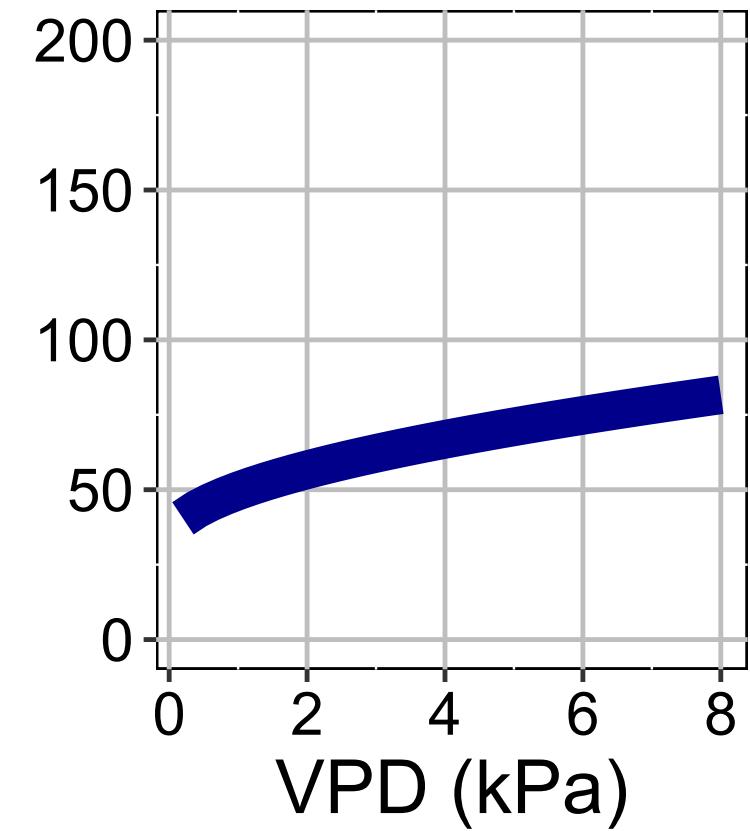

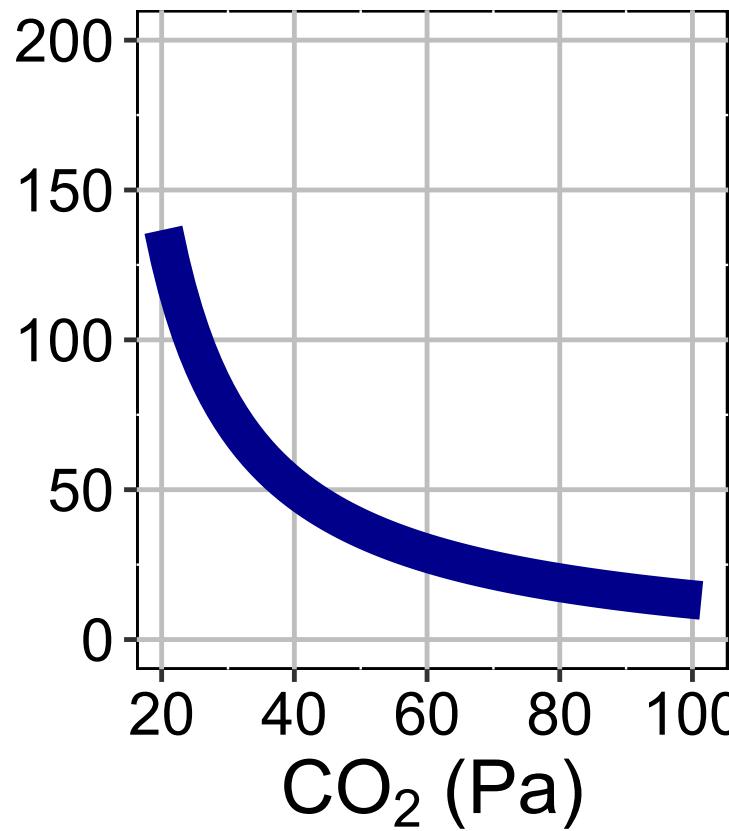

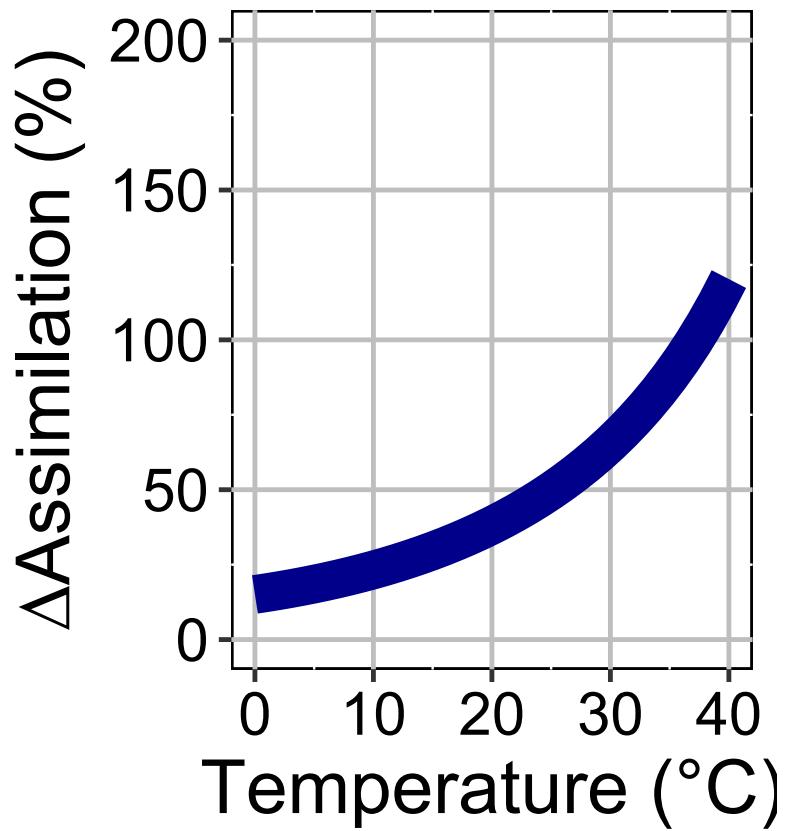

No, plants respond to added nitrogen by increasing leaf area, not photosynthesis

Question 4: Will C<sub>4</sub> be  
advantageous in the future?

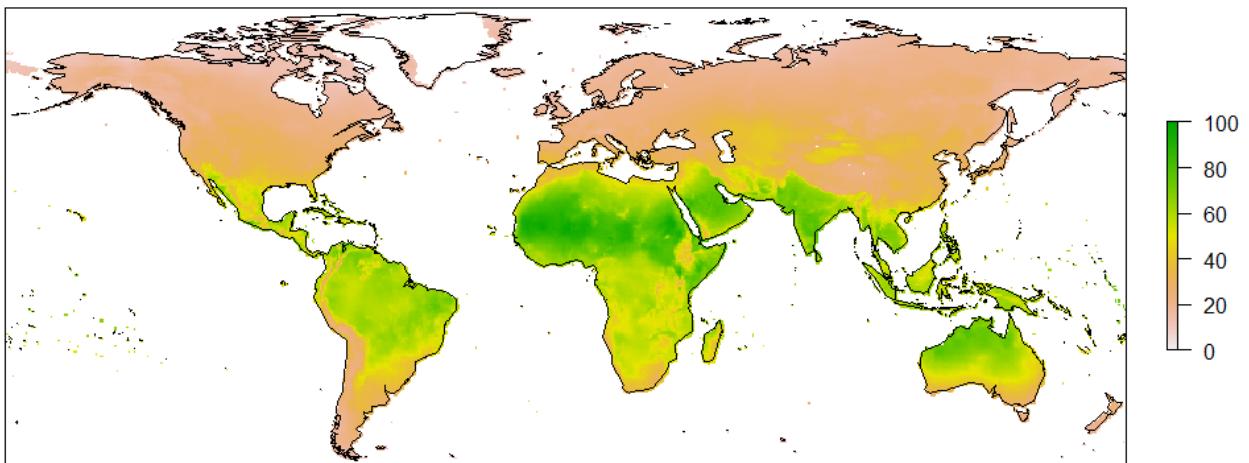

Helen Scott  
TTU

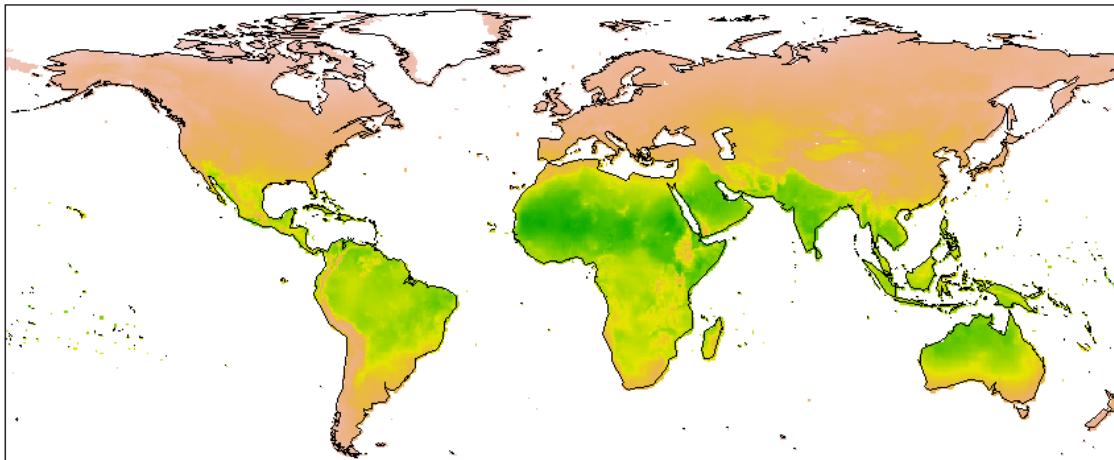

# Relative advantage of C<sub>4</sub> physiology

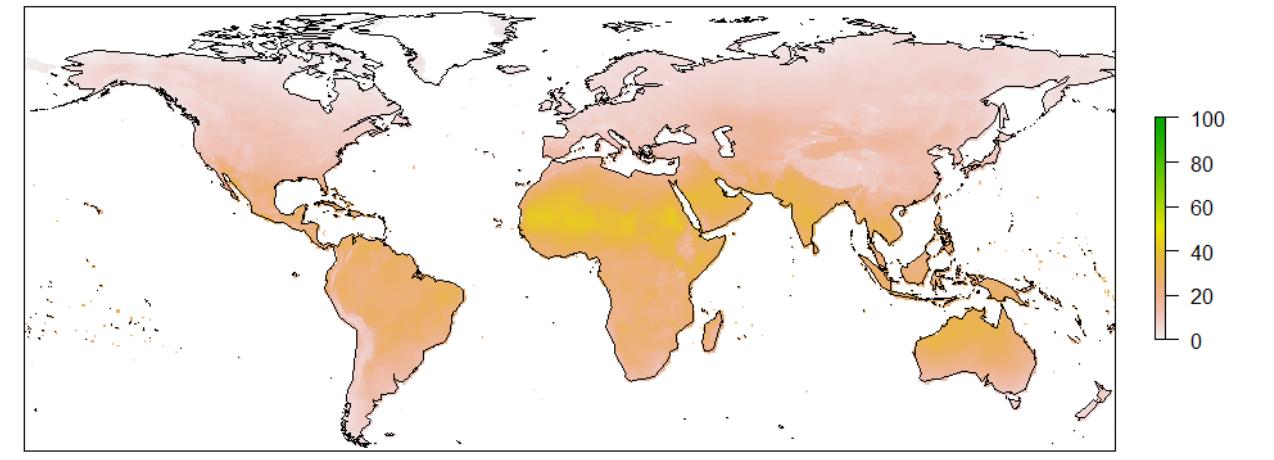

## Current relative advantage of C<sub>4</sub> (%)

Current relative advantage of C<sub>4</sub> (%)

Future relative advantage of C<sub>4</sub> (%)

Question 4: Will C<sub>4</sub> be  
advantageous in the future?

Elevated CO<sub>2</sub> will negate C<sub>4</sub>  
advantages in the future

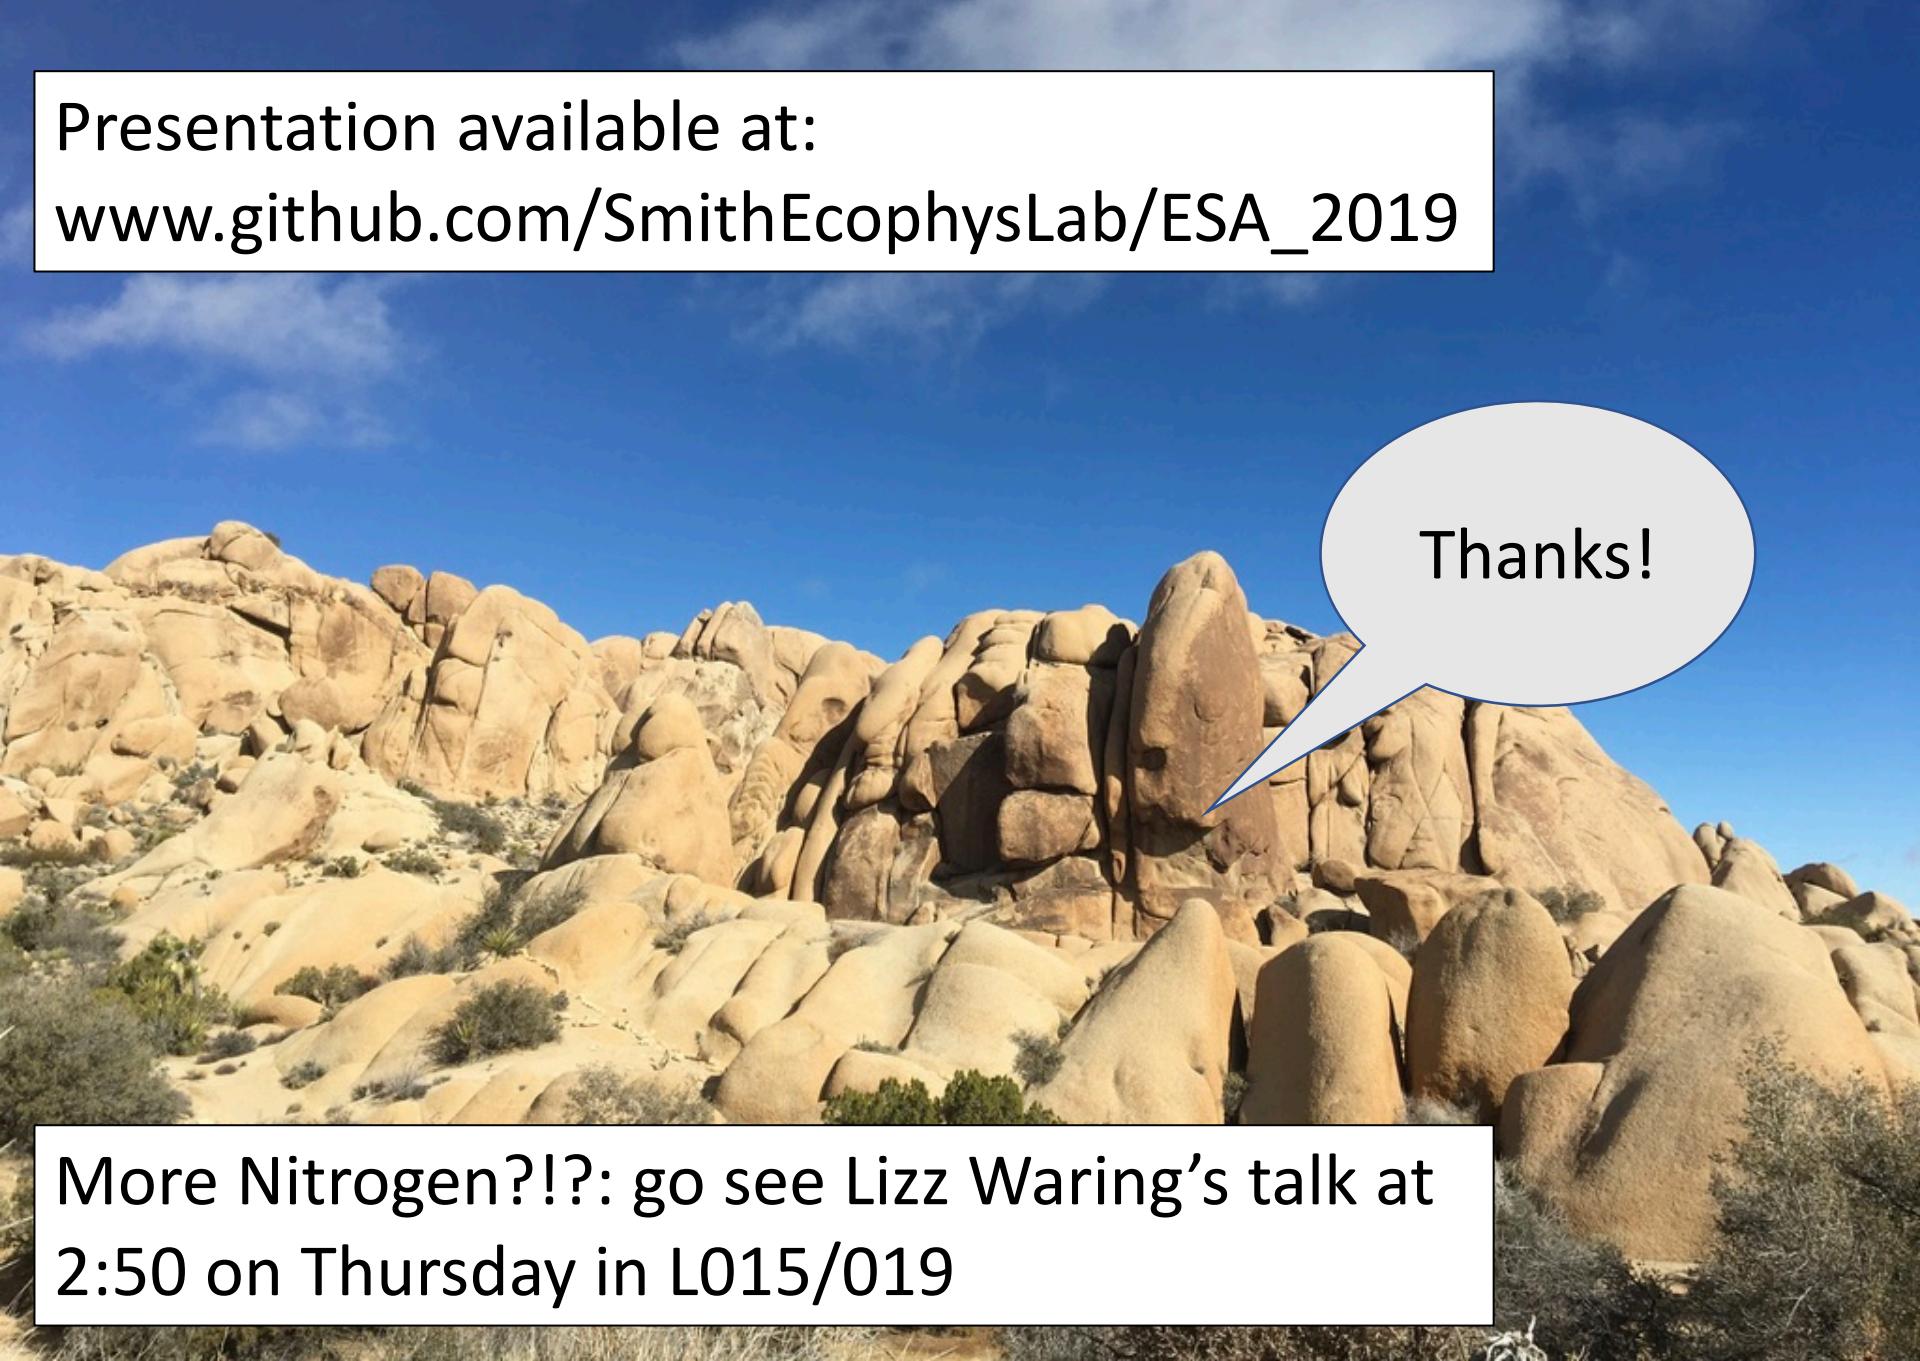

# Conclusions

Theory can be useful!

- Improving the reliability of climate models
- Acting as a null model for understanding mechanisms
